

A Research Report

BRIDGING THE DIGITAL DIVIDE

A Comprehensive
Assessment of Foundational
Digital Literacy in the Vanni
Region of Sri Lanka

2024

Research Partners

Technical Partner

This is a collaborative research project between the Vavuniya University (Sri Lanka) and the Gate Institute (UK). Galli Galli / ASER Nepal and Karkhana Global (KG) provided technical support in tools development, research design, data analysis and finalizing the report. The data collection was conducted between September 2023 and March 2024.

Research Team

Senthan Selvarajah, CEO, GATE Institute, UK/Sri Lanka

Mathivathany Sasitharan, Senior Lecturer in Project Management, Faculty of Business Studies, University of Vavuniya

Rajib Timalisina, Assistant Professor, Department of Conflict Peace and Development Studies, Tribhuvan University, Co-Founder of ASER Nepal

ACKNOWLEDGEMENT

We extend our heartfelt gratitude to the dedicated students of the University of Vavuniya, Sri Lanka, whose efforts as data collectors were instrumental to the success of this study. Our sincere appreciation also goes to the esteemed professor Prof. T. Mangaleswaran, Former Vice Chancellor, University of Vavuniya and leadership team at University of Vavuniya, Sri Lanka for their unwavering guidance and support throughout the research process. We are deeply thankful to the founders and supporters of the Gate Institute, UK, for their vision and contributions, which made this collaborative effort possible. Additionally, we acknowledge the invaluable technical support provided by Sakar Pudasaini (KG, USA), and the dedicated staff of ASER Nepal / Galli Galli and Karkhana Global (KG), whose expertise and insights were vital in shaping this research. We express our gratitude to those who supported the data collection process from three districts and to the respondents for providing their valuable data and time for this research. Your collective efforts have significantly advanced this important work on digital literacy.

EXECUTIVE SUMMARY

INTRODUCTION

This report presents the findings of a comprehensive digital literacy assessment conducted in the Vanni region of the Northern Province of Sri Lanka, where the last phase of the civil war took place 15 years ago, causing severe damage to human life and economic and social structures. Collaboratively undertaken by the University of Vavuniya, Sri Lanka and The Gate Institute, UK/ Sri Lanka, the study highlights the disparities in access to digital infrastructure and skills across Vavuniya, Mullaitivu, and Mannar districts of Vanni. Leveraging UNESCO's Digital Literacy Global Framework, the research identifies barriers, explores mediating variables like gender and socioeconomic status, and offers actionable policy recommendations to ensure digital inclusion for all.

METHODOLOGY

The research employed a Citizen-Led Assessment (CLA) model using a three-stage stratified sampling method to ensure representativeness across 1,347 households and 2,975 individuals in Vavuniya, Mullaitivu, and Mannar districts. Data collection involved contextual and assessment questionnaires aligned with UNESCO's Digital Literacy Global Framework (DLGF), capturing device ownership, internet access, and proficiency in 15 digital skills.

FINDINGS

1. Digital Infrastructure Access

The assessment reveals that smartphones are the most widely available digital devices, with 92.3% of households owning at least one. Mannar district leads in smartphone penetration, with 98.85% of households reporting ownership. Internet access is relatively high across the three districts, with Mannar showing the highest connectivity rate at 90.48%, followed by Vavuniya (85.86%) and Mullaitivu (85.41%). Mobile connections dominate as the primary means of internet access, while broadband usage remains limited. In contrast, ownership of computers and tablets is significantly lower, with only 12% of households owning a computer and 5.4% owning a tablet.

2. Digital Literacy Skills

Proficiency in digital skills varies significantly across basic, intermediate, and advanced levels. Foundational tasks such as charging devices, making calls, and saving contacts exhibit high proficiency rates, exceeding 95%. Moderate proficiency is observed in tasks like web browsing (79%) and conducting keyword searches (83%). However, advanced skills show significant gaps, with only about 50% of respondents proficient in email-related tasks such as creating, reading, and sending emails, and 17% finding employment through websites and social media, only 30% accessing government services through websites.

3. Gender Disparities

Gender-based differences are evident in both device ownership and skill proficiency. Males report higher ownership of computers and laptops and outperform females in advanced skills like online research and email usage. Conversely, women slightly excel in basic tasks such as saving contacts, reflecting potential differences in access and usage patterns.

4. Age-Based Trends

The study highlights clear age-based trends in digital literacy. Younger respondents, particularly those aged 12–18, demonstrate higher proficiency in advanced digital skills, such as social media usage and online browsing. In contrast, older respondents aged 30–40 show greater proficiency in basic tasks like making phone calls and operating devices.

5. Socioeconomic Gaps

The findings indicate a strong correlation between household wealth and digital literacy. Wealthier households exhibit better proficiency in advanced skills, such as web browsing and email usage. However, basic skills remain consistent across all socioeconomic groups, suggesting that foundational competencies are less influenced by economic disparities.

These findings underscore the need for targeted interventions to address gaps in advanced digital skills, bridge gender disparities, and improve access to digital infrastructure in underserved communities.

CONTEXT

The University of Vavuniya, Sri Lanka, and The Gate Institute, UK/Sri Lanka, have jointly initiated this assessment to address the challenges and opportunities of digital literacy in the Vanni Region of Northern Province, Sri Lanka. The University of Vavuniya, established as the 17th state university of Sri Lanka, is a premier institution for higher education in the Vanni region, specializing in Applied Science, Business Management, and Technological Studies. The Gate Institute, a not-for-profit organization registered in the UK (Reg No: 14476509) and Sri Lanka (Reg No: GL00303974), is committed to community empowerment through innovative research. This collaboration builds on an existing Memorandum of Understanding (MoU) between the two organizations, designed to facilitate research and knowledge exchange. Technical support for developing the assessment tools, designing the citizen-led assessment model and analyzing survey findings was provided by Galli Galli / ASER Nepal, renowned for their expertise in citizen-led assessments.

The potential of Information and Communication Technology (ICT) to empower marginalized communities and improve governance is immense. Small-scale innovations have proven effective in addressing challenges like disaster response, human trafficking prevention, and reducing corruption in service delivery. However, large-scale ICT deployment in governance requires an understanding of existing hierarchies and power dynamics. Questions remain: Who within households gets to use digital devices? Who possesses the necessary skills? Are marginalized groups sufficiently motivated and equipped to go online? These considerations underscore the importance of understanding digital literacy comprehensively to design user-centric interfaces and interventions.

Globally, digital literacy is recognized as a means to empower citizens and enhance public service delivery (Ferrari, 2012; Law et al., 2018). Its inclusion in the Sustainable Development Goals (SDG), particularly indicator 4.4.2, highlights its significance in addressing the global digital divide (GEM Report, 2020). This research seeks to develop tools that assess minimum digital literacy competencies in rural contexts, informed by UNESCO's Digital Literacy Global Framework (DLGF).

The DLGF serves as the theoretical foundation for this study, aligning with SDG 4.4.2 to establish a coherent standard for digital literacy (Law et al., 2018). Methodologically, the study adopts the Citizen-Led Assessment (CLA) approach, proven to be scalable and cost-effective (Wadhwa, 2020). While digital tools are increasingly accessible and affordable, gaps in understanding who can effectively use these tools persist. The lack of a globally agreed-upon minimum proficiency standard hampers data aggregation and action-oriented insights (Laanpere, 2019).

This study builds on UNESCO's DLGF for two key reasons. First, the framework consolidates existing research to define digital literacy comprehensively (Law et al., 2018). Second, Sri Lanka, as a signatory to the SDGs, is committed to aligning its policies with global standards, making this framework highly relevant.

Data on digital literacy must also account for mediating variables such as gender, income, and geography. For instance, data from Nepal's Annual Status of Education Report indicates that while 71.9% of households have mobile devices, only 57.4% of women have access to them, and just 30.2% use the internet compared to 50% of men (ASER Nepal, 2019). Relying solely on internet penetration rates risks exacerbating existing disparities.

In Sri Lanka, the Department of Census and Statistics reports digital literacy rates of 57.2% and computer literacy rates of 34.3% as of 2021. Urban sectors lead with 49% computer literacy, compared to rural (32.3%) and estate (13.9%) areas. Youths aged 15–19 exhibit the highest literacy rates (71.4%), but significant disparities persist, with Northern Province reporting only 27.9% computer literacy (Department of Census and Statistics, 2021). These findings underscore the need for a comprehensive digital literacy assessment, particularly in rural areas.

Recognizing the limitations of existing data, this study leverages UNESCO's framework to develop a robust Digital Literacy Assessment tool. The goal is to equip youth in Northern Sri Lanka with basic digital competencies, ensuring their inclusion in the digital economy. This ambitious project aims to empower communities through evidence-based policy interventions and capacity-building initiatives.

OBJECTIVES AND RESEARCH QUESTIONS

This overarching objective of our study is to produce global public goods in the form of open source and free to use tools and data that will support governments and philanthropists to design interventions that bridge the digital divide, ensuring the use of digital tools to deliver essential services in emergency contexts.

The key research questions that will drive our research are:

1. **Who has access to digital infrastructure?**
2. **Who has the necessary skills to utilize this infrastructure?**
3. **Are there any mediating variables - such as gender, geography or ability - that define or explain varying degrees of digital literacy?**
4. **What are the lived experiences of marginalized groups in relation to digital literacy skills and digital tool use? Can specific interventions be designed to address these experiences?**

RESEARCH PROCESS AND DESIGN

The research process for this digital literacy assessment follows a comprehensive, four-phase approach: tool development, tool validation, full-scale Citizen-Led Assessment (CLA) data collection led by youth, and data processing. The study is rooted in UNESCO's Digital Literacy Global Framework (DLGF), targeting Sustainable Development Goal (SDG) 4.4.2. Each phase is designed to ensure robust methodology, community engagement, and practical outcomes.

1. TOOL DEVELOPMENT AND VALIDATION

The initial phase involves developing tools anchored in the UNESCO DLGF, supported by an extensive review of global literature on digital literacy, Citizen-Led Assessments, and relevant policy frameworks, including Vision 2030 targets and e-governance strategies. A contextual questionnaire gathered essential demographic data such as age, gender, and household assets. This is complemented by an assessment questionnaire, which evaluates respondents' ability to perform 15 tasks linked to UNESCO DLGF categories 0, 1, and 2. The survey captures household device ownership, internet connectivity, and proficiency in 15 digital skills, including email usage, web browsing, and social media engagement.

The list of 15 tasks are:

T01	Task: Charging the device	Able to do	Not able to do
T02	Task: Switching a phone on/off (smart phone)	Able to do	Not able to do
T03	Task: Lock/unlock device with password	Able to do	Not able to do
T04	Task: Connect to internet/data	Able to do	Not able to do
T05	Task: Making, receiving and ending phone call.	Able to do	Not able to do
T06	Task: Opening a web browser	Able to do	Not able to do
T07	Task: Use key words to conduct searches	Able to do	Not able to do
T08	Task: Taking photos/videos and accessing them	Able to do	Not able to do
T09	Task: Record voice notes and access them	Able to do	Not able to do
T10	Task: Saving new contact	Able to do	Not able to do
T11	Task: Find phone number from contact list	Able to do	Not able to do
T12	Task: Writing text message	Able to do	Not able to do
T13	Task: Sending email.	Able to do	Not able to do
T14	Task: Reading email.	Able to do	Not able to do
T15	Task: Create a new email.	Able to do	Not able to do

2. CITIZEN-LED ASSESSMENT DATA COLLECTION

Data collection employed the citizen-led assessments (CLA) method in collaboration with local governments and Civil Society Organizations (CSOs). A Training-of-Trainers (TOT) model equips community partners to recruit, train, and deploy assessors. Data collection was supported by mobile technology and monitored through a web-based platform. To uphold quality, data for every tenth household was rechecked. If three or more errors were found in a settlement's dataset, the entire settlement's data was reassessed.

3. RESEARCH METHODOLOGY

This research represents the first comprehensive digital literacy assessment conducted in Sri Lanka, focusing on the districts of Vavuniya, Mullaitivu, and Mannar in the Vanni region of the Northern Province, Sri Lanka. Using a quantitative survey approach grounded in the Citizen-Led Assessment (CLA) model, the study employs a rigorous three-stage stratified sampling method to ensure representativeness. In the first stage, 70 villages or settlements were selected proportionally across the three districts: 21 from Mannar, 18 from Mullaitivu, and 31 from Vavuniya. The second stage involved mapping each village into four equal sections, sampling five households per section, for an average of 20 households per settlement. Out of 1,400 targeted households, 1,347 households completed the survey (401 in Mannar, 355 in Mullaitivu, and 591 in Vavuniya), with a response rate of over 96%. The third stage focused on assessing all individuals aged 12 to 40 years within these households, excluding those outside this age range. This process resulted in a detailed dataset encompassing 2,975 individuals. The household-based assessment captured critical variables such as device ownership, internet connectivity, and proficiency in 15 digital literacy skills. Data gaps due

to missing responses were managed through exclusion and re-analysis to ensure robustness. This meticulous methodology lays a solid foundation for understanding digital literacy trends across diverse socio-geographic contexts in Sri Lanka.

The sample size of 1,347 households and 2975 respondents ensures a 95% confidence level with a $\pm 2.7\%$ margin of error, exceeding the typical requirements for robust quantitative research. The low non-response rate (3.79%) further enhances reliability, making this study highly representative and statistically sound.

4. DATA ANALYSIS AND ETHICAL SAFEGUARDS

The data analysis process for this research employed a combination of Python-based computational tools and descriptive statistical methods to derive meaningful insights from the survey data. The dataset, comprising responses from 1,347 households and 2,975 individuals, was systematically cleaned to address missing values and inconsistencies, ensuring reliability and accuracy in the findings. The analysis began with foundational descriptive statistics, summarizing key demographic, infrastructure, and digital literacy variables, such as household size, device ownership, and internet connectivity. Further, the 15 assessed digital literacy competencies were evaluated through percentage distributions, highlighting trends in basic, intermediate, and advanced skills. Stratified analyses explored mediating variables like gender, age groups, and socioeconomic quartiles, uncovering disparities in access and proficiency.

This research followed high ethical standards. The safety of all participants was the primary objectives of our ethics policy. Informed consent was obtained from all participants and, when required, from the caretakers of those unable to provide consent themselves. Participants were offered choices regarding their degree of participation in all aspects of the project and asked to provide on-going consent when data was generated. Ethical safeguards included obtaining informed consent, ongoing consent for participation, and compliance with a safeguarding policy based on Save the Children's public guidelines for respondents below 18 years, and also adhering to UKRI's safeguarding principles for overall research. The research adhered to the UIS Data Quality Standard Framework (2018) for monitoring and evaluation. The data collection process emphasized transparency, accuracy, and reliability, setting a high standard for replicability in future research.

KEY HIGHLIGHTS

- Survey Scope: **1,347** households and **2,975** individuals across three districts.
- Methodology: Citizen-Led Assessment, supported by mobile technology and rechecks for data quality.
- Focus Skills: Aligned with UNESCO DLGF, covering tasks from basic operations to advanced digital competencies.
- Three Districts of Vanni Region, Northern Province: Mannar, Vavuniya and Mullaitivu
- **70** Settlements/Villages
- **1347** Households
- **2975** Individuals ranging 12-40 years

KEY FINDINGS

HOUSEHOLD DEMOGRAPHIES

4.28 Average Household Members

2.53 Average Population Aged 12-40 Years

ROOFING

93.1% of households have finished roofing.

5.3% use natural or rudimentary roofing.

WALLS

93.7% of households have finished walls.

4.0% use natural or rudimentary materials.

Drinking Water Sources

Common sources include piped water (**39.1%**), wells (**28.4%**), and bottled water (17.8%).

Less common sources include rivers/streams and hand pumps.

Electricity

97.7% of households have electricity connections.

Device Availability

Smartphones: Available in **92.3%** of households

Computers and Laptops: 12% have computers, while 20% have laptops.

Tablets: Available in only **5.4%** of households.

Appliances

Television: Found in **75.9%** of households.

Radio: Owned by **41.1%**

Motor Vehicles

Motorbikes (**62.4%**) are the most common

Cars, vans, and three-wheelers are significantly less common.

- **Household Roofing Distribution:** The dominance of finished roofing materials.
- **Household Walls Distribution:** High prevalence of finished walls.
- **Main Drinking Water Sources:** Highlighting the diversity in water sources.
- **Electricity Connection Status:** Demonstrating widespread access to electricity.
- **Device Availability:** Smartphones are the most prevalent, with fewer computers and tablets.
- **Appliances and Vehicles:** Shows the popularity of motorbikes and televisions.

- Smartphone access is nearly universal, with slight variations: Mannar (98.85%), Mullaitivu (97.63%), and Vavuniya (96.46%).
- Internet access is relatively high across districts, with Mannar leading at 90.48%, followed by Vavuniya (85.86%) and Mullaitivu (85.41%).
- All households without internet access still reported ownership of a smartphone.
- A small percentage of households lacking internet access also reported no electricity connection:
 - » Mannar: 4.82%
 - » Mullaitivu: 2.56%
 - » Vavuniya: 5.98%
- Internet access increases dramatically, primarily via mobile connections. Broadband usage is extremely low.
- Districts with higher smartphone ownership show significantly higher rates of internet connectivity, particularly through mobile connections. Mannar exhibits a notable gap in internet connectivity among households without smartphones. Mullaitivu and Vavuniya demonstrate similar trends, but broadband access remains limited across all districts
- Although mobile internet connectivity is at its peak due to high smartphone usage, this does not mean internet access and usage are satisfactory in the region because smartphone usage is almost universal nowadays, with over half of the world's population owning a smartphone.

INDIVIDUAL DEMOGRAPHIES

Gender

Age Distribution

Ages are diverse, with the most frequent ages being 40, 23, and 28. The age distribution among respondents across major age groups is as follows:

Education Level

Job Status

DIGITAL AND SMARTPHONE BEHAVIOR OF INDIVIDUAL RESPONDENTS

Smartphone Access:

Major Sources of News

A mix of TV and social media (16.5%) is most common.

Hours Spent on Smartphones:

Social Media Usage

Facebook, YouTube, WhatsApp/Viber, and Messenger are dominant platforms.

Purpose of Smartphone Use

Includes calls, browsing, social media, learning, and entertainment.

Frequency of Googling Information

Verification of Information

Mobile Banking App Usage

Majority do not have banking apps (60.2%).

Sharing Passwords

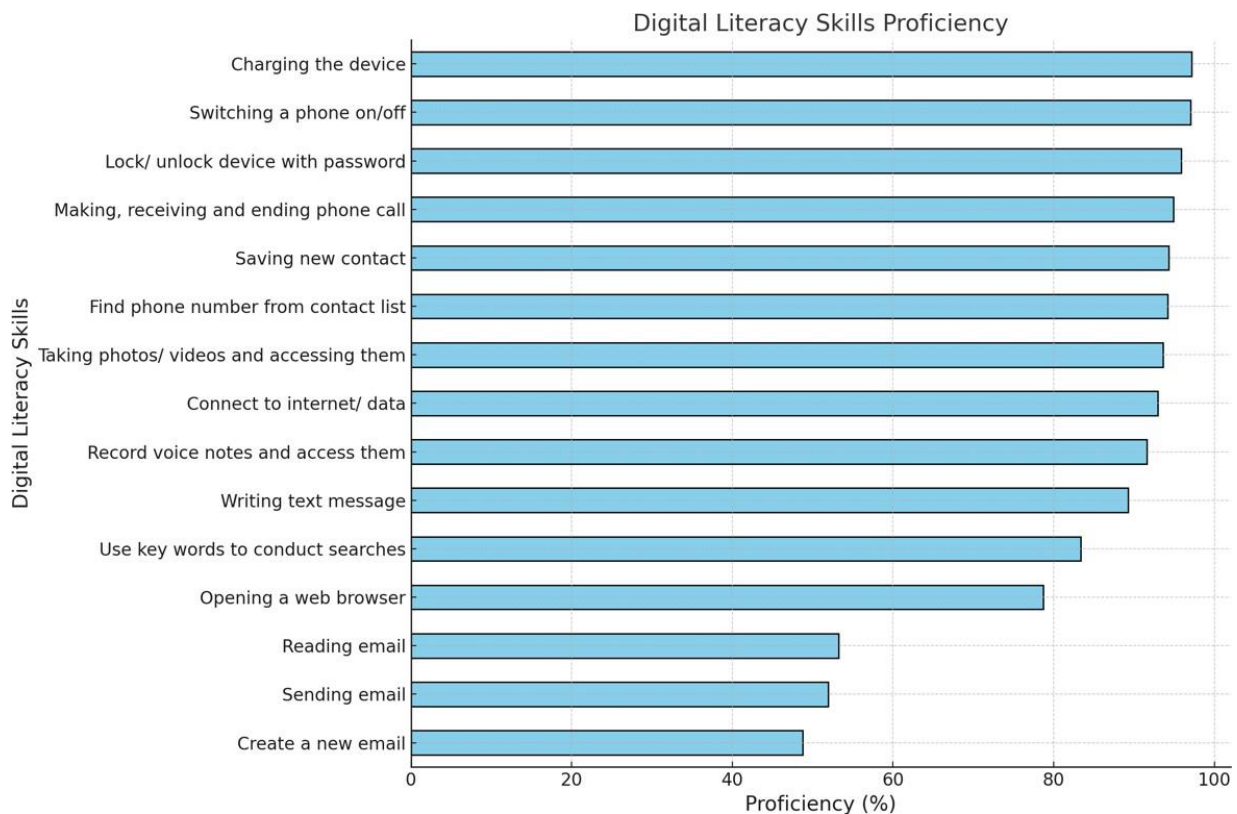

NO
95.2%

DIGITAL LITERACY COMPETENCIES AND SKILLS

The findings highlight strong proficiency in basic skills like charging devices, making calls, and saving contacts, while tasks like creating and using email show relatively lower proficiency.

Chart 1: Overall Digital Literacy Competencies and Skills

Key Observations:

1. High Proficiency Skills:

- Basic tasks such as "Charging the device" (97%), "Switching a phone on/off" (97%), and "Making, receiving, and ending phone calls" (95%) show near-universal proficiency.
- Skills like "Taking photos/videos" (94%) and "Saving contacts" (94%) also exhibit strong proficiency levels.

2. Moderate Proficiency Skills:

- Intermediate skills like "Opening a web browser" (79%) and "Using keywords for searches" (83%) show slightly lower proficiency.
- These skills indicate a transition from basic to more complex digital literacy.

3. Low Proficiency Skills:

- Advanced tasks, including "Sending emails" (52%), "Reading emails" (53%), "Mobile Banking App Usage" (38.2%), "Googling" (17.5 % always), "Verification of information" (61%) and "Creating new emails" (49%), are significantly less prevalent.
- This suggests that email-related tasks may be less familiar or less relevant to some respondents.

Chart 2: Gender wise distribution of Digital Literacy Skills

Gender-wise Proficiency Key Observations

1. Consistent Trends:

- Both genders exhibit high proficiency in foundational skills, such as "Charging the device" and "Making phone calls".
- Male and female respondents show similar patterns for basic and intermediate skills.

2. Gender Gaps:

- Advanced Skills:
 - » Males tend to perform slightly better in "Opening a web browser", "Using keywords for searches", and "Creating emails".
- Basic Skills:
 - » Females show slightly higher proficiency in "Saving contacts" and "Taking photos/videos".

Chart 3: Age Wise Distribution of Digital Literacy Skills (Bar Chart and Line Graph)

Age-wise Proficiency Key Observations:

1. Proficiency Trends by Age Group:

- Younger age groups (12-18, 18-24) demonstrate high proficiency in advanced skills like “Opening a web browser” and “Using keywords for searches”.
- Older age groups (24-30, 30-40) show stronger performance in foundational skills like “Making calls” and “Switching phones on/off” and lower performance in advanced competencies such as “email usage”

- Although the age groups 24-30 and 30-40 are older compared to the age groups included in this study, this age group should have a significant level of advanced digital literacy skills. However, these findings highlight the possibility that the low level of advanced competence among this age group may be due to the severe war situation in the Vanni region that prevailed 15 years ago when they were students.

2. Age Gaps in Advanced Skills:

- The proficiency in “Creating new emails” and “Reading emails” declines in older age groups, suggesting less exposure or relevance.
- There are smoother transitions in proficiency across skills and age groups, emphasizing that younger respondents excel in advanced tasks.

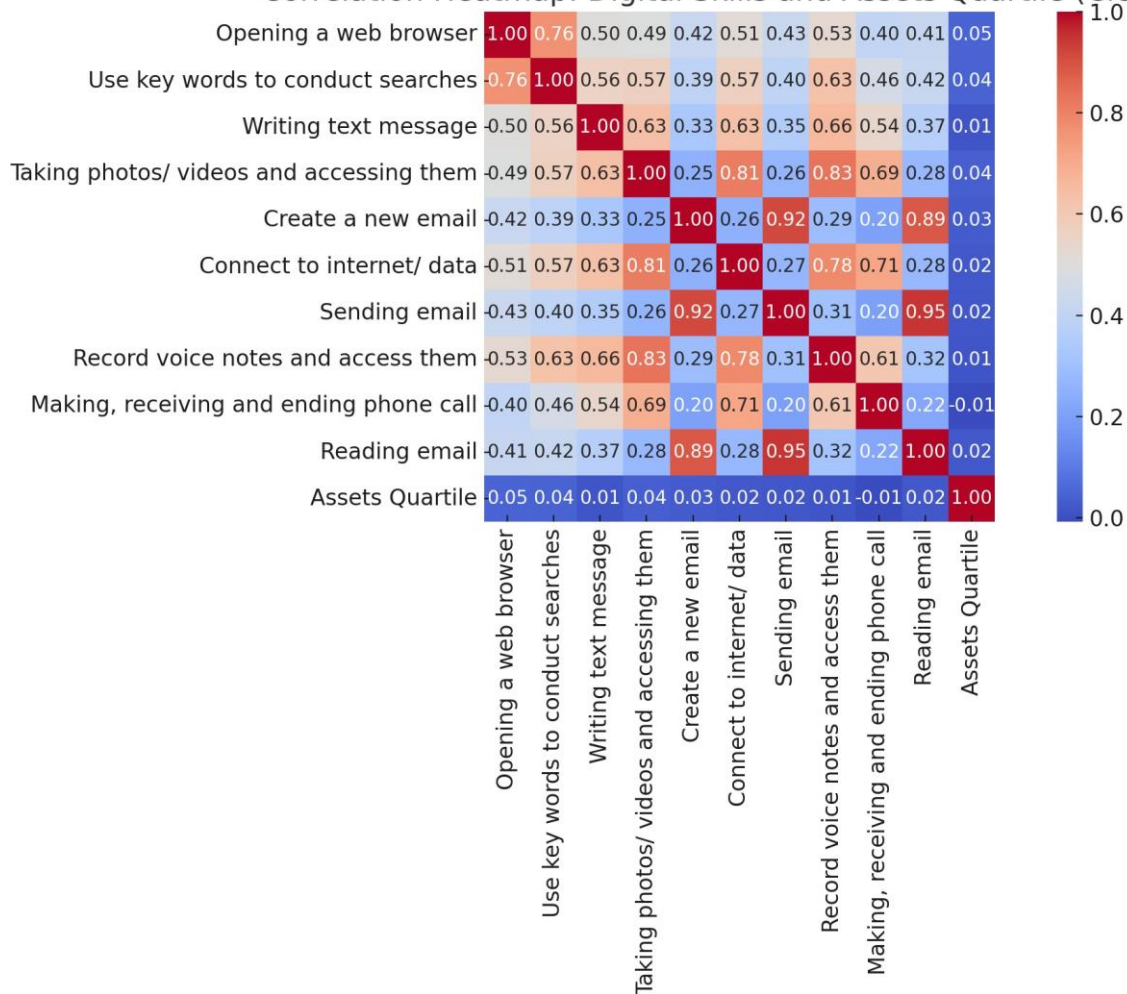

Chart 4: Digital Literacy Skills by Household Assets

Age-wise Proficiency Key Observations:

- Higher quartiles (wealthier households) exhibit better proficiency in advanced skills, such as “Opening a web browser”, “Sending emails”, and “Using keywords for searches”.
- Foundational skills like “Charging the device” and “Making calls” remain consistent across all quartiles.
- Digital literacy, particularly advanced skills, positively correlates with wealth.
- The gap between poorer and wealthier quartiles is most pronounced in skills requiring internet access or more expensive devices.

Correlation Heatmap: Digital Skills and Assets Quartile (Cleaned)

- Skills like "Opening a web browser" (0.049) and "Using keywords to conduct searches" (0.039) show the strongest positive correlations with asset quartiles, indicating higher proficiency among wealthier households.
- Basic skills such as "Lock/unlock device with password" (-0.024) and "Find phone number from contact list" (-0.012) show slight negative correlations, suggesting these skills are less dependent on household wealth.
- Skills like "Charging the device" (-0.003) and "Making calls" (0.010) show little to no correlation with asset quartiles.

Strong Positive Correlations:

- Skills such as "Opening a web browser" and "Using keywords to conduct searches" exhibit the highest positive correlations with household assets quartiles. This indicates that individuals from wealthier households are more proficient in advanced, internet-based skills.

Moderate Correlations:

- Skills like "Creating a new email" and "Taking photos/videos" show moderate correlations, suggesting these skills are also influenced by household wealth but not as strongly as browsing or search-related skills.

Minimal Correlations:

- Foundational skills such as “Charging the device” or “Making calls” have negligible correlations, reflecting their universal nature across socio-economic groups.

Thus, the heatmap highlights that advanced digital skills are more dependent on socio-economic factors, as indicated by their positive correlation with asset quartiles. Basic skills are consistent across all groups, showcasing a baseline level of digital familiarity.

Usage of Digital Platform for Life Skills:

- **Internet for Job Opportunities:** Approximately **8 out of 10 respondents** do not use the internet for job-related purposes, indicating a significant gap in leveraging digital platforms for employment opportunities.
- **Internet for News:** Around **4 out of 10 respondents** do not access news through the internet, suggesting that traditional media still holds relevance for a considerable portion of the population.
- **Social Media Usage:** Despite the popularity of social media, about **3 out of 10 respondents** do not engage with social media platforms.
- **Internet for Government Services:** Close to **7 out of 10 respondents** do not use the internet for accessing government services, this situation highlights critical gaps in the adoption of e-governance solutions.

These findings emphasize the need for advanced digital skills training programs to address the significant non-usage rates in these critical areas, especially for job opportunities, e-governance, and life skills development.

CONCLUSIONS AND RECOMMENDATIONS

This digital literacy assessment has provided valuable insights into the state of digital access, skill proficiency, and barriers across the Vanni region of the Northern Province of Sri Lanka. While foundational skills such as making phone calls and saving contacts are nearly universal, significant gaps remain in advanced competencies like email proficiency and internet navigation, particularly among older individuals and economically disadvantaged groups. The findings highlight the urgent need for educational interventions targeting advanced skills, with a specific focus on fostering email usage and online research capabilities. Advanced competencies, such as email usage, mobile banking app and job-search skills, are essential for accessing existing opportunities, creating new opportunities, and empowering the disadvantaged. Gender disparities also persist, as women report lower participation in advanced digital tasks. Targeted programs should aim to bridge this gap by increasing female involvement in skills such as email creation and usage, which are critical for professional and personal empowerment.

Addressing socio-economic disparities is another critical area of focus. Policymakers must prioritize the expansion of digital infrastructure and provide subsidized devices for lower-income households to enable skill development. The study also emphasizes the potential of youth as a key demographic, as younger respondents demonstrate higher proficiency in advanced digital skills. Leveraging their abilities through peer-led digital literacy programs can effectively bridge skill gaps. Furthermore, the findings suggest that systemic and economic factors, rather than the availability of electricity or smartphones, are the primary barriers to internet access, underscoring the need for comprehensive strategies to ensure equitable digital inclusion. By implementing these recommendations, Sri Lanka can empower its communities, align with global standards like UNESCO's Digital Literacy Global Framework, and advance toward achieving the Sustainable Development Goals.

PARTNERS AND COLLABORATORS

THE UNIVERSITY OF VAVUNIYA

The Vavuniya Campus of the University of Jaffna has been elevated to a separate state University and established as the “University of Vavuniya, Sri Lanka” by the extraordinary gazette issued on 08th June 2021. Accordingly, the University of Vavuniya became the 17th state university in Sri Lanka effective from 01st August 2021. The University of Vavuniya offers as well as proposes the courses within several faculties, namely, Faculty of Medicine, Faculty of Tourism and Hotel Management, Faculty of Health Sciences, Faculty of Aquaculture, Fisheries and Marine Studies, Faculty of Environmental Science, Faculty of Livestock, Faculty of Humanities and Social Sciences, and Faculty of Graduate Studies.

THE GATE INSTITUTE (UK/SRI LANKA)

The Gate Institute is a non-profit organisation registered in Sri Lanka (Reg No: GL00303974) and the UK (Reg No: 14476509). It provides interventions through critical and transformative research on the socio-economic problems faced by underserved communities, primarily in Sri Lanka. To this end, it has signed MoUs with universities in Sri Lanka and is collaborating with diplomatic missions, international think tanks, diaspora, NGOs, and charities.

ASER Nepal / Karkhana Global (NEPAL / USA)

ASER Nepal (hosted by Galli Galli) and Karkhana Global (KG) provided technical support in designing and implementing this citizen-led assessment based research. ASER Nepal works on foundational literacy assessment in Nepal since 2015. Karkhana Global (KG) is a co-located between Seattle, Washington and Kathmandu, Nepal. Karkhana Global (KG) works across three broad areas: Digital Transformation, Innovation in Education and Skilling for Innovation. Karkhana Global is part of the Karkhana network, which includes social businesses and non-profit organizations focused on STEAM education in South Asia.
